Sequence 17067, Application US/09949016

Patent No. 6812339

GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYMORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THER

FILE REPERENCE: CL001307

CURRENT APPLICATION NUMBER: US/09/949,016

CURRENT PILING DATE: 2000-04-14

PRIOR APPLICATION NUMBER: 60/241,755

PRIOR APPLICATION NUMBER: 60/237,768

PRIOR APPLICATION NUMBER: 60/237,768

PRIOR APPLICATION NUMBER: 60/231,498

PRIOR APPLICATION NUMBER: 60/231,498

PRIOR FILING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOPTWARE: FastSEQ for Windows Version 4.0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the nucleotide sequence of a tomato polygalacturonase genomic DNA CC clone isolated from a genomic library by screening with polygalacturonase CC cDNA. The polygalacturonase gene promoter is active in at least the CC breaker through red fruit stage in tomato fruit, and can be used in a CC novel method of the invention for producing a plant with an altered CC phenotype. In this method, regulatory regions from genes expressed during a particular developmental stage or in a specific tissue are identified CC count screening. The regulatory regions are manipulated for use with Creign sequences for introduction into plant cells to provide CC transformed plants having a phenotypic property that can be modulated. CC The invention is exemplified with light, seed and fruit-specific CC promoters. Transformation without gall formation of cells which are not CC Agrobacterium hosts, especially cereals and legumes, is achieved.

CC This is the nucleotide sequence of a tomato polygalacturonase genomic DNA CC clone isolated from a genomic library by screening with polygalacturonase CC cDNA. The polygalacturonase gene promoter is active in at least the breaker through red fruit stage in tomato fruit, and can be used in a CC breaker through red fruit stage in tomato fruit, and can be used in a CC novel method of the invention for producing a plant with a regulatable CC phenotype. In this method, regulatory regions from plant genes (and T-DNA CC and Ti or Ri plasmids) are manipulated for use with foreign sequences for introduction into plant cells to provide transformed plants having a CC phenotypic property that can be modulated. The invention is exemplified CC with light, seed and fruit-specific promoters. Also claimed are methods CC contacted the genotype of a plant to impart a desired CC clasue, modifying the genotype of a plant to impart a desired CC characteristic to fruit, modifying transcription in fruit tissue, and CC expressing a heterologous DNA sequence of interest specifically in fruit CC tissue. The method provides transformation without gall formation in CC plants which have historically not been Agrobacterium hosts. (Updated on CC C5-MAR-2003 to correct PR field.)

The constructs can be used for the expression of heterologous genes in plants. They can be used for modifying the phenotype of plants. The DNA sequence of interest may encode an enzyme or may comprise an antisense sequence. The constructs can be used in plants such as soybean, rapeseed, cotton, safflower or sunflower. The present sequence represents the polygalacturonase genomic clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Local Similarity

The method is useful for obtaining plants having modified phenotype or for altering the phenotype of a plant seed or tissue. The DNA constructs are used in manipulating plant cells to provide for regulated transcription, such as light inducible transcription, in a plant tissue or plant part of interest at particular stages of plant growth or in response to external control. These constructs are also used for modulation of expression of endogenous products as well as production of exogenous products in the seed. The present sequence represents the nucleotide sequence of polygalacturonase (PG) genomic clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

New DNA construct comprising a promoter region, a DNA sequence interest and a transcription termination region, useful for pro transgenic plants. producing

Example 15; Fig 8 68pp; English.

CC The invention relates to a DNA construct comprising, as operably linked components in the direction of transcription, a promoter region CC obtainable from a gene, e.g. a napin gene, an EA9 gene or an acyl carrier protein (ACP) gene, a DNA sequence of interest other than the native CC coding sequence of the gene and a transcription termination region, where is flanked by T-DNA. Also included are a plant cell and where the DNA construct is flanked by T-DNA. Also included are a plant cell having an altered CC comprising cells comprising a DNA construct, a seed obtained from the CC plant, obtaining a plant having a modified phenotype or modifying the CC distinct from other plant tissue, altering the phenotype of plant seed tissue or modifying transcription in seed tissue as distinct from other plant tissue, altering the phenotype of plant seed construct is useful in modifying or altering the genotype of plant seed construct is useful in modifying or altering the genotype or phenotype of plant to impart a desired characteristic. The construct is also useful cc a plant to impart a desired characteristic. The construct is also useful cc a plant to impart a desired characteristic. The construct is also useful cc a plant to impart a desired characteristic. The construct is also useful cc a plant to impart a desired characteristic. The construct is also useful cc a plant to impart a desired characteristic. The construct is also useful cc a plant to impart a desired characteristic. The construct is also useful cc a plant to impart a desired characteristic. The construct is also useful cc a plant to harded response to light and dehydration resistance and utrient construct is also useful cc and construct is construct is also useful cc and construct is construct is also useful cc and construct is const

```

The polygalacturonase genomic clone may be inserted into a fruit specific DNA construct containing the transcription initiation region 2All. The constructs allow modification of plant phenotypes during fruit maturation and ripening. (Updated on 31-0CT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.) (Updated PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        899
```

밁 S

This is the sequence of clone pTOM6 which contains the coding sequence polygalacturonase (PG). It was used to isolate the PG promoter in the construction of a vector encoding antisense RNA to the PG cDNA and PG gene. This would be useful to regulate the expression of the fruit softening enzymes in flowering and fruiting plants. Such antisense RNA would delay fruit softening. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct OS field.) 2003 to correct OS field.)

Of.

Recombinant DNA for flowering and fruiting plants e.g. tomatoes ripo control - comprises base sequence for transcription contg. inverted sequence of bases complementary to bases in anti sense ribonucleic encoding softening enzymes, or gene expression regulation.

tomatoes ripening

Modifying pectin, for foodstuffs preparation, involves transforming host having pectin methylesterase (PME) and polygalacturonase (PG) activity by silencing PG activity, to increase PME to PG ratio.

Claim 6; Fig 1; 78pp; English

The invention provides a new method for modifying pectin that involves CC providing a host having pectin methylesterase (PME) activity and polygalacturonase (PG) activity, transforming the host by silencing PG activity to provide an increased PME to PG ratio, preparing a PME extract from the transformed host, and using the PME extract to modify pectin. A CC PME modified pectin is useful for foodstuffs preparation, and to impart an increased functionality to food products such as yogurt, milk/fruit juice and whey drinks PME is useful to reduce the number of ester groups in a pectin in a block-wise manner, and to de-esterify two or more CC in a pectin in a block-wise manner, and to de-esterify two or more CC adjacent galacturonic acid residue of a pectin on at least substantially all of the pectin chains. The present sequence represents the cDNA sequence of pTOM6 encoding a PG enzyme. A nucleotide sequence (seq Id No. 3) encoding the PG enzyme which is deposited as pTOM23 with NCIMB CC is not provided in the specification

Sequence 1636 BP; 598 A; 232 C; 290 G; 516 T; 0 U; 0 Other;

The inverted sequence and the PG mRNA form double-stranded structure which inhibits expression of the PG mRNA. See also AAN80488. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1637 BP; 598 A; 232 C; 290 G; 517 T; 0 U; 0 Other;

CC differentiating between haematopoietic cell proliferative disorders CC associated with at least 1 gene and/or their regulatory regions in a Subject. The method comprises contacting a target nucleic acid in a CC biological sample obtained from the subject with at least 1 reagent, CC which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09861 to ABZ1118 CC represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for CC differentiating between healthy haematopoietic cells and proliferative CC differentiating between the present and proliferative CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for CC determining the cytosine methylation state and/or single nucleotide CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the constitution of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting disorders,

                                                                    용
                                                                                             श्
                                                                                                                                                                                                          The present invention describes a method for detecting and differentiating between haematopoietic cell proliferative disorders consecrated with at least 1 gene and/or their regulatory regions in a consultation of the comprises contacting a target nucleic acid in: a biological sample obtained from the subject with at least 1 reagent, contacting a target nucleic acid in: a biological sample obtained from the subject with at least 1 reagent, contacting a target nucleic acid. ARZ09861 to ARZ1118 convention. Oligonucleotides from the present invention can be used: for differentiating between healthy hatematopoietic cells and proliferative convention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative convention. Oligonucleotides from the present invention can be used: for differentiating between acute | 1 convention convention cells; for differentiating between acute | 1 convention cells and acute myelogenous leukaemia, as probes for convention to can be used for determining the cytosine methylation state and/or single nucleotide golymorphisms (SNPs) of haematopoietic cell proliferation disorder related DNA sequences for their complements; and as primers for the camplification of haematopoietic cell proliferation can also be used for detecting a predisposition to, differentiation between convention can also be used for detecting a predisposition to, differentiation between convention can also be used for detecting a predisposition to, differentiation between convention can also be used for detecting a predisposition to, differentiation between accordances allowing for improved and informed treatment of patients
                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC This is the nucleotide sequence of the tomato Mi locus associated with CC nematode resistance, obtained from a bacterial artificial chromosome CC (BAC). Mi was localised by genetic analysis to a region of the tomato CC genome of about 65 kb. DNA corresponding to this region was cloned into CC PAC vectors. Sequence analysis of a 52 kb BAC3 insert identified 3 open CC reading frames, one of which is probably a pseudogene. By RNA blot CC canalysis, transcripts of approximately 4 kb corresponding to copy 1 and CC copy 2 were found in both resistant and susceptible tomato roots and in CC leaves of resistant but not susceptible plants. CDNA sequences CC corresponding to full-length transcripts of copy 1 (see. AAV26082) and CC copy 2 (see AAV26083) were obtained. The encoded polypeptides (see CC known plant resistance genes (R genes) of the nucleotide binding site/CC Leucine-rich repeat (NBS/LRR) family. A recombinant expression cassette CC comprising an Mi polynucleotide and an operably linked plant promoter can CC be used to enhance nematode resistance in plants especially tomatoes CC (claimed). Transgenic plants can also be constructed using a Mi promoter CC with heterologous genes; the Mi promoters can be used to express a CC levels to resistance on the same temporal and spatial patterns and at similar CC levels to resistance comes

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          aminocyclopropane-1-carboxylic acid synthase (ACC synthase) LB-ACS7 gene CC and subtraction by restriction enzyme digestion. The LB-ACS7 gene is the carboxylic acid synthase (ACC synthase) LB-ACS7 gene is CC rapidly and transiently induced in waterlogged roots and in wounded CC rhythmic pattern that slightly precedes the diurnal fluctuation of CC rhythmic pattern that slightly precedes the diurnal fluctuation of CC promoter, that provide transient expression of a desired protein or mRNA CC within minutes of stimulus. The promoters, especially the LB-ACS7 gene CC promoter, that provide transient expression of a desired protein or mRNA CC within minutes of stimulus. The promoters can be induced by environmental CC chemicals. The LB-ACS7 promoter can be recombinantly fused to a CC cassettes, such as flooding or wounding, without the application of CC cassettes. Flooding can be used to induce expression of e.g. genes that CC control resistance to insect pests or pathogens, or which confer CC alternatively, the promoter may be used to transcribe an mRNA that is not translated into a protein. e.g. antisense RNA or ribozymes. The LB-ACS7 CC promoter contains an region, designated LBACS7Soll3, that shows homology to polygalacturonase promoter nuclear protein binding DNA sequences (see also ABN84857-59)
